

HTML

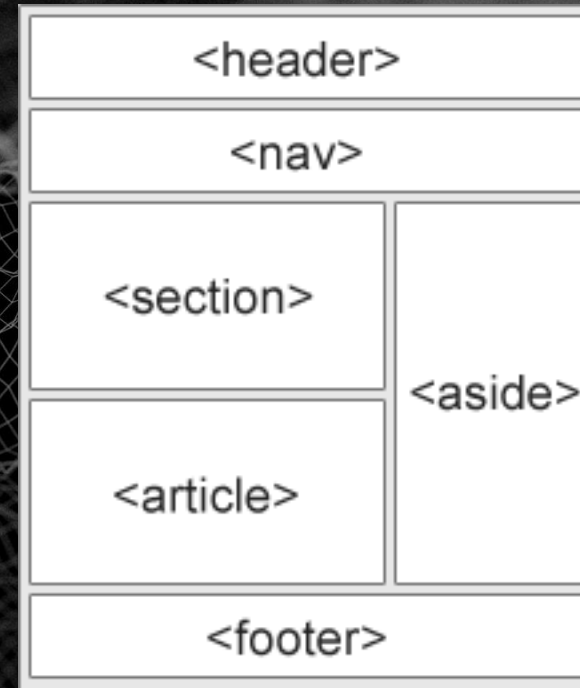

HTML Semantic Layout

HTML semantics

Semantic elements are **HTML** tags that have meaning. They tell both the browser and developers what kind of content is inside.

Semantics is about using the right word so everyone instantly knows what it stands for.

e.g. The **<header>** element tells us that it belongs on the top of a page.

We have both semantic and non-semantic elements, but we'll see it in the next slide.

HTML semantic types

Semantic elements:

1. `<header>`
2. `<nav>`
3. `<h1>` to `<h6>`
4. `<p>`
5. `<table>`
6. `<aside>`

And many more.

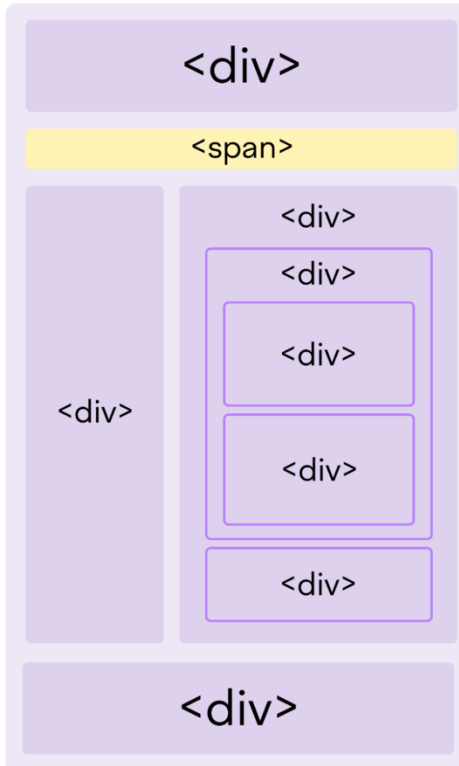

Non-semantic elements:

1. `<div>`
2. `<span>`
3. `<b>`

And others.

What Is Semantic HTML?

Non-Semantic HTML

Semantic HTML
